**BEANLOGIN**

# Case Study

# What is BeanLogin?

BeanLogin is an Identity and Access Management System that provides authentication and authorization capabilities to critical applications within an organization.

BeanLogin's chrome extension provides a seamless browsing experience to its users by automatically logging them into their favorite websites.

# Tech Stack & Category

## Technologies

1. Java 8
2. Python
3. Maven
4. Cassandra
5. Spring Boot
6. AngularJS
7. Hibernate

## Category

Identity Management &  
Password Vault

## URL

<https://beanlogin.com>

# Key Features

- The chrome extension then lets you login automatically to your saved accounts, seamlessly across all your devices
- BeanLogin allows you to store all of your daily work applications password at one place so you can use it as a password vault.
- It allows you to manage your applications by categorizing the apps using tab functionality
- You can share app/tab with other peoples like we do document sharing.
- You can create notes in the beanlogin application for ease of usage.
- Beanlogin has its Android and iOS mobile app by which you can get the all functionality on mobile also.
- It provides the SSO functionality for business and one click sign for individuals
- you can store your passwords of all application at single application

# How it works?

If you enable the SSO in your organization then rather login to the each system you just need to login to BeanLogin application, BeanLogin will work as identity provider for all organization application which support SSO. So rather than remembering the password of each application you just need to remember BeanLogin application password. For your other personal app if you added your credentials in the BeanLogin system and chrome extension is installed on your device, on click app it will prefill the cred for you and you can get into any system by one click.

**Thank You!**
