2. ASP.net
3. REST Services
4. JavaScript
5. HTML/CSS
6. JQuery
7. Bootstrap

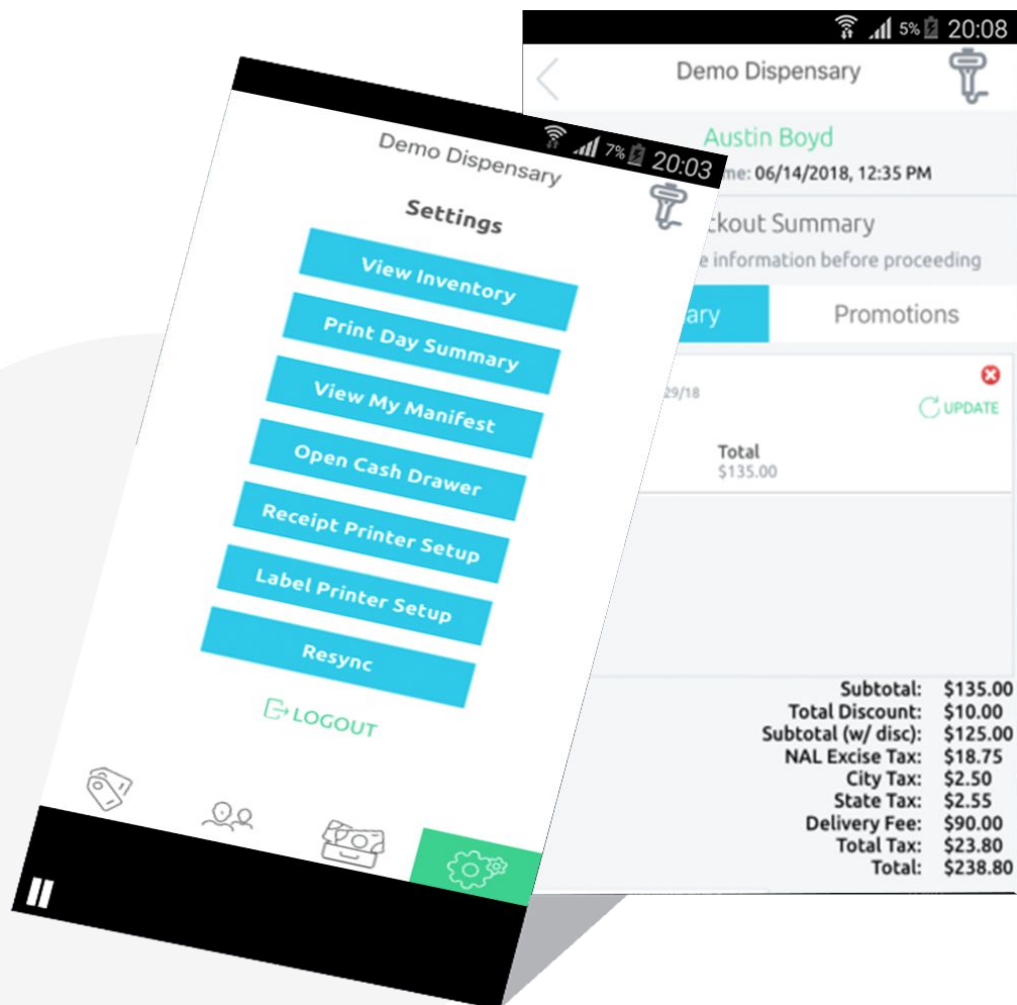

## Category

Retail Point of Sale Application

## URL

<https://blaze.me>

# Key Features

- Track inventory, customers, orders and respective receipts of orders including discounts and promotions
- Cash drawer and past order receipts maintenance capability
- Customer engagement module to keep track of all customer information including physician recommendations and agreements with the Dispensary store
- Offline facility to add customer, process Transaction and finish order
- Capability to cater multiple shops under one operator and multiple employees under one manager

# How it Works?

Blaze application has capability to keep track of Customer and their orders.

Operator can add new customer to the application which will include his information which is required by state laws, and sign a agreement with the particular Dispensary.

Once customer is in the system, operator can initiate his order/transaction by placing him in the queue of the customers who are visiting the store. Once queue is started for the customer, operator will have to process his transaction by adding required product by the customer, this list of products related to the shops will be available in the system on the cloud.

Operator can easily keep track of invoices and transactions made in the shop, also with the open and close drawer feature help to tally the cash available end of the day.

Two levels of authentication has implemented in application 1. Manager, 2. Employee. So multiple employees can use the application using their authentication to place orders and add customers.

**Thank You!**
